About our program

The pediatric epilepsy program at UF Health in Gainesville, Florida, offers children the latest and most advanced treatment options for epilepsy care.

The surgical program is led by **Jason Blatt, MD**, who specializes in pediatric epilepsy and oversees each child's care plan. He works closely with **S. Parrish Winesett, MD**, a pediatric neurologist who has extensive experience with complex epilepsy, including presurgical evaluations and advanced EEG monitoring.

Together, Drs. Blatt and Winesett are committed to providing state-of-the-art care to improve the quality of life of our patients. The pediatric epilepsy team strives to alleviate worry and suffering while providing world-class care for children of all ages.

What to expect

The process of deciding if a child will benefit from epilepsy surgery involves extensive testing and can take several months. We need to have as much information as possible in order to choose the right surgery and do it safely.

Our pediatric epilepsy surgery team in Gainesville meets almost every week to discuss our patients and their test results. Epilepsy surgery evaluations happen in phases, and not every patient has to undergo every test.

Jason Blatt, MD, FAANS
Assistant Professor
Division of Pediatric Neurosurgery
UF College of Medicine

S. Parrish Winesett, MD
Associate Professor
Division of Pediatric Neurology
UF College of Medicine

Diagnostic procedures used to evaluate patients for epilepsy

- › Electroencephalogram, or EEG, testing, which is also known as "brain wave" testing
- › Functional brain mapping
- › Functional MRI, or fMRI
- › Magnetoencephalogram, or MEG
- › MRI
- › Neuropsychiatric battery testing
- › PET-CT
- › Positron emission tomography, or PET
- › Single-photon emission computerized tomography, or SPECT, scan
- › Wada testing

After testing is done, our expertly trained UF neurologists and neurosurgeons collaborate to determine the best treatment plan. If surgery is deemed a necessary next step, our team will work with the patient's family to determine a date, and surgery will be scheduled.

Robot-assisted surgery for patients with epilepsy

ROSA is a state-of-the-art surgical tool that UF Health pediatric neurosurgeons use during epilepsy operations. ROSA's software allows exceptionally safe and precise epilepsy surgery. The ROSA system reduces surgical time by half compared with other methods and is less invasive, which means less time under anesthesia and lower risk of infection.

Please visit neurosurgery.ufl.edu/peds-epilepsy for our comprehensive parent's guide to epilepsy surgery.
